

Data Classification Policy

Soundbite.AI recognizes the importance of properly classifying and segmenting information to ensure data security and operational integrity. We categorize data into three levels: Public, Confidential, and Secret. Each classification determines the appropriate storage, access controls, and handling requirements.

Data Classifications

The following categories of Soundbite business data are recognized along with example of such data and the correct place for their store and sharing.

Public

Data that is intended for public consumption and distribution.

- **Examples:** Marketing materials, publicly accessible website content, and documentation.
- **Storage and Access:** Public data is stored in systems like OneDrive, where canonical copies are maintained. It can be transmitted via email and does not require specialized access controls.

Confidential

Sensitive information that requires secure storage and authenticated access to ensure privacy.

- **Examples:** Policy and strategy documents, customer and partner agreements.
- **Storage and Access:** Confidential data is stored in authenticated systems such as Microsoft Teams, OneDrive, and HubSpot. It is shared securely, either through authenticated email links via OneDrive or direct messages through Microsoft Teams.

Secret

Highly sensitive information that demands strict role-based access and adherence to the principle of least privilege.

- **Examples:** Source code in Azure DevOps available only to developers, Azure environments accessible only by role and with least privilege principles
- **Storage and Access:** Secret data is stored in systems that enforce role-based access controls. Access is granted only to individuals based on their specific roles and responsibilities. For example, configuration data is segregated by environment (e.g., development, preview, production), with each environment accessible only to the relevant personnel.
