

Security Incident Response Plan

Last updated by | Erik Ralston | Feb 21, 2023 at 7:57 PM PST

The following article describes the broad steps for security incidents with the Soundbite platform and organizational data. In the event of attack or leak, the following represents the broad strokes of our approved action plan.

Overview

The following are key work areas when responding to a security incident. The roles and responsibilities on the team should include both technical resources with sufficient knowledge to identify, contain, and investigate, plus business-focused resources with the knowledge and skill to handle communication. They should work together to review and improve the entire process.

- **Identify and report the incident:** The first step is to identify that an incident has occurred and report it to the appropriate parties, such as your security team or Azure support. This could be done through an incident response tool or by contacting the relevant parties directly.
- **Contain the incident:** Once the incident has been reported, the next step is to contain it. This might involve disabling affected systems or limiting access to certain resources to prevent further damage. In some cases, it may be necessary to take the affected systems offline entirely.
- **Investigate the incident:** With the incident contained, it's time to investigate what happened. This could involve examining logs and other data sources to determine the scope of the incident, how it occurred, and what data was affected.
- **Assess the impact:** Based on the investigation, you'll need to assess the impact of the incident. This could include identifying what data was compromised and what systems were affected, as well as any potential legal or regulatory implications.
Remediate the incident: Once you have a clear understanding of the incident and its impact, you'll need to remediate it. This could involve patching vulnerabilities, restoring data from backups, or taking other steps to ensure that the incident doesn't happen again.
- **Communicate with stakeholders:** Throughout the incident response process, it's important to communicate with stakeholders, such as customers or partners. This could involve notifying them of the incident, providing regular updates on the status of the response, and offering guidance on how they can protect themselves.
- **Review and improve:** Once the incident has been resolved, it's important to conduct a review to identify what went well and what could be improved. This could include reviewing incident response procedures, examining security controls, and implementing changes to prevent similar incidents from occurring in the future.
